Description The 'MPCR' package provides new data-structure support for multi- and mixed-precision for R users. The package supports 16-bit, 32-bit, and 64-bit operations with the ability to perform mixed-precision operations through a newly defined tile-based data structure. To the best of our knowledge, 'MPCR' differs from the currently available packages in the following: 'MPCR' introduces a new data structure that supports three different precisions (16-bit, 32-bit, and 64-bit), allowing for optimized memory allocation based on the desired precision. This feature offers significant advantages in-memory optimization. 'MPCR' extends support to all basic linear algebra methods across different precisions. 'MPCR' maintains a consistent interface with normal R functions, allowing for seamless code integration and a user-friendly experience. 'MPCR' also introduces support for the tile-based matrix data structure with mixed precision, enabling the utilization of a range of tile-based linear algebra algorithms.

Value

MPCR object (constructor - accessors - methods)

Constructor

new Creates a new instance of zero values of the MPCR class. `new (MPCR, size, "precision")`

size The total number of values for which memory needs to be allocated.

Accessors

The following accessors can be used to get the values of the slots:

Methods

The following methods are available for objects of class MPCR:

PrintValues: `PrintValues()`: Prints all the values stored in the matrix or vector, along with metadata about the object.
